Other novel pathways of spread suggested by experts included:
farm stays, raptors and predators moving dead or infected
chickens from one farm to the other, especially those that
could carry but not be infected themselves. For layers, the
number of dead birds is small and does not justify pick up.
The presence of these groups of species indicates that water
has been exposed to conditions that might have resulted in
contamination by pathogenic species of microorganisms.

Sampling locations may be varied. Although this sometimes
might be the case, the current reality of environment
pollution is that there is an increasing deterioration of the
microbiological quality of the consumption water. These horses
are generally years, which is older than the age of affected
flat race horses that mostly is between 2 to 5 years.
